All computer operating systems in use today support serial ports because serial ports have been around for decades. Parallel ports are a recent invention and are much faster than serial ports. USB ports are only a few years old and will likely completely replace both serial and parallel ports in the coming years. The name "serial" comes from the fact that the serial port "serializes" data. This means that it takes a byte of data and transfers 8 bits in a byte at a time. The advantage is that a serial port only needs one line to transmit 8 bits (whereas a parallel port needs 8). The disadvantage is that data transfer takes 8 times longer than with 8 wires. Serial ports reduce cable costs and make cables smaller. Before each byte of data, the serial port sends a start bit, which is a single bit with a value of 0. After each byte of data, it sends a stop bit to signal the end of the byte. It can also send a parity bit. Serial ports, also called communications (COM) ports, are bidirectional. Thanks to two-way communication, each device can both receive and send data. Serial devices use different pins to receive and send data—using the same pins would limit communication to half-duplex, meaning information can only be sent in one direction. The use of different pins provides full duplex communication where information can be transmitted in both directions simultaneously. Serial ports use a special controller chip called a Universal Asynchronous Receiver/Transmitter (UART) to function properly. The UART chip takes the parallel output of the computer's system bus and converts it to serial form for transmission through the serial port. For faster operation, most UART chips have a built-in buffer of 16 to 64 kilobytes. This buffer allows the chip to store data coming from the system bus while it processes data coming into the serial port. Although most standard serial ports the maximum transfer rate is 115Kbps (kilobits per second), high-speed serial ports such as Enhanced Serial Port (ESP) and Super Enhanced Serial Port (Super ESP) can reach a transfer rate of 460Kbps. Our mobile phones have become an integral part of our daily lives. Our phones usually contain a lot of personal and even business information that we need to carry out our daily activities. From setting an alarm to creating to-do lists, creating documents, connecting with family and friends through messaging apps and social networks, to all forms of virtual audiovisual entertainment, our phones do everything for us and are an integral part of us. When using our phones, the battery can run out and needs to be recharged to get the most out of it. So what do you do when you put your charger in your phone's charging port but it won't charge? Before you panic or get hysterical, try the following ways to fix your mobile phone charger port. HOW TO REPAIR A PHONE CHARGER SOCKET Try a different power source. The problem that the phone is not charging may not be caused by the phone or the charger, but by the outlet that the charger is plugged into. Try plugging the charger into a different outlet. Perhaps you charged with an extension cable, you can switch to charging directly from the wall. If you are charging from an outlet, replace it with a different one. If you charged your computer via a USB port, switch to a different port or try charging directly from the AC adapter. If your mobile phone starts charging, then you have found the problem. Simply call an electrician to fix a faulty network adapter, buy a new adapter, or repair your computer's USB port. Check your charging cable Charging cables are often the most common reason your phone won't charge when plugged in. Charging cables wind and unwind, twist and unwind many times, especially in regular transportation, which some of us may not dotake our chargers with you everywhere. The charging cable could be damaged. Replace the charging cable with a different one and see if the mobile phone is charging, if so then the charging cable is faulty. Check the charger adapter If you have replaced the charger cable and the phone still does not charge and you are sure that the charger cable is not damaged, you need to check the charger adapter. Unplug the charging cable and check the connection port between them, does it feel burnt? Does the connection port look rusty? Does the charging cable vibrate when plugged in or does it not connect properly? Then replace the charger adapter. Also, do not use any adapters or charging cables to charge your phone, each phone has specific voltage requirements for efficient charging and your charger must meet these requirements. Make sure you replace the charging cable by buying from reputable stores like Carlcare offices that sell genuine products. Turn off your phone. Sometimes the phone is actually powered by the charger and the AC adapter works fine, but there is a bug in the phone software that confirms the phone is charging so the battery status bar doesn't change. Powering off your phone may resolve this issue. You can also hard reset the phone by pressing the volume up button and the power button. Then try to charge it, if it responds to charging, it might be a problem. Check the mobile phone charging port. We often put our phones in our pockets and other places without a case to protect the charging port. Dirt and debris can get into the charging port and prevent the charger from fully connecting to the phone. Take the light source and look into the phone's charging port. If you find visible dirt and debris, take a soft toothbrush and clean the phone's charging port. You can also use the tip of a cue for this. Do not use objects such as toothpicks or paper clips. A jar of toothpicksHack the charging port or even damage the charging port. Paperclips are made of metal and can therefore conduct electricity. They are also sharp and can cause injury. After cleaning dirt and grime, if you try to charge if it works then everything is fine. WHERE TO REPAIR THE PHONE CHARGING PORT If all the above methods did not work, the cell phone charging port is probably damaged and needs to be repaired. It is not recommended to repair the phone charging port by yourself. Forget online tutorials that promise to teach you how to fix your phone's charging port. Your limited knowledge and skills can further damage the device. Get rid of this by going to a professional phone repair shop like Carlcare service to fix your cell phone charging port. Carlcare is a professional aftermarket brand with over 2,300 service centers in over 50 countries. We are the only authorized aftermarket supplier for Infinix, Tecno and Itel phones. While most phone chargers and charging cables look the same, there can be a big difference between their quality and charging speed. It is always recommended to use the official Samsung charging cable as it is specially designed for your device and designed to maximize battery life. Using an unofficial charger may damage your phone. Officials have the correct voltage for your device, while alternative chargers may work with a different voltage. Make sure you are not using counterfeit accessories. Learn more about the different types of USB cables. You connected your iPhone or Android phone to the charger and... nothing happened. From broken or rusty charging ports to faulty power cords, there are many reasons why your phone might not charge, and not all of them can be easily repaired at home. A common reason for improper charging is that your charging port, be it Lightning on iPhone 13 or USB-C on phones, is liking itGoogle Pixel 6 Pro is clogged with bags after a few months and the cable doesn't fit anymore. Luckily, this is one of the easiest and cheapest fixes to your charging problem. Here's how to fix it. Why is my charging port blocked? There are no caps on the phone's charging port, meaning it's exposed to whatever dust, dirt, and grime it encounters. Every time you put your phone in your pocket, your phone tends to lint, and if like me you have pockets full of dirt after accidentally washing jeans with old bills in the pockets, trouble begs trouble. And I'm not talking about the cookie crumbs I have there. Don't ask me why I have cookie crumbs in my pockets. It won't be a problem overnight, but these little dust and lint particles will accumulate over months or years of phone use, clumping together each time you plug in the charging cable until they form a solid barrier that prevents the charger from pushing it all the way in and you can plug it in and charge it. internal parts. Andrew Hoyle/CNET If you've had your phone for over six months and are starting to notice that your charger is becoming less stable (especially if you have to flip it over to start charging), dirt in your port is very likely to blame is. How to clean your phone's charging port Unlocking your phone's charging port is a simple task. You'll need a cocktail stick, toothpick, or other thin object to stick into the port and scrape off the dirt. Wood or plastic are better as they are less likely to rub against something inside and potentially cause damage. I did this with a metal simulation removal tool and while it worked fine, it's not the safest option for your phone. Plug the selected tool into the charging port until it turns on and gently start scraping. OUTYou can slide the Lightning port on the iPhone back and forth, but with the USB-C you have to scratch the charging connector, which is located in the middle of the port. put it here Andrew Hoyle/CNET Eventually, you loosely compact the compacted dirt and can push the material out of the port. It's a rewarding process and you might be surprised at how many things actually come out. Also, work gently on the sides of the connector, but be careful not to seriously scratch any of the metal charge connectors. In the end you have almost everything. It's hard to tell if you've gotten rid of it all because even with a good light in hand, it's hard to see into the harbor. But once you get some crap out of it, you can try the charging cable again. Satisfactorily remove the crap from your phone's charging port. Andrew Hoyle/CNET Hopefully it now connects more securely and starts loading. If not, try removing more dirt and test the charger again. If that still doesn't solve the problem, it's time to consider another solution, e.g. B. a new cable or charger. Charger.
