This class deals with the representation, analysis and design of discrete time signals and systems. The main concepts covered include: discrete time processing of continuous time signals; decimation, interpolation and conversion of sample rate; flow structures for DT systems; time and frequency design techniques for recursive (IIR) and non-recurring (FIR) filters, linear prediction; discrete Fourier Transformion, FFT algorithms; short-term Fourier analysis and filter banks; multirate techniques; Hilbert transforms Cepstral applications. I would like to express my thanks to Thomas Baran, Myung Jin Choi, and Xiaomeng Shi for compiling the lecture notes on this site from my individual lectures and their contributions and their class notes during the semesters they were students in the course. These lesson notes, the textbook and the included problem sets and solutions will hopefully be helpful as you learn and explore the theme of discrete-Time signal processing.
