

I'm not a robot

To solve the issues with the latest GCC update on Gigabyte motherboards, follow these steps: For those affected by the recent update, ensure error logging is enabled in GCC. Please respond with your GPU model (revision also if it's more than 1.0) and a copy of the error log. You can also post these logs to the Aorus Discord for further assistance. Navigate to C:\Program Files\GIGABYTE\Control Center\Lib\Download, locate GBT_VGA_23.03.10.01.exe, and reinstall it from there. This has fixed the issue for me, but some confirmation would be helpful. For those without the GBT_VVA_23.03.10.01.exe locally on their machine, a direct link is available from Gigabyte's servers: update was released on April 11th that fixes the issue around GBT_VVA_23.04.07.02. GBT_VVA_23.04.11.01 is now available for download within GCC. Some issues may still exist, so please report any problems below. Given text: Example of your answer output-paraphrased text here has anybody else experienced similar issues with their new beta bios? EDIT: the errors are related to the new bios, after reverting to f13 codes the codes disappeared
