Clear blue fake pregnancy test

false positives occur when people get results that they actually didn't have the actual hCG hormone in there body. we will look at some common things that can lead to false positive pregnancy tests. some of these include timing errors, user error, taking certain medications and having a chemical pregnancy. clear blue is a popular brand but still false positives can occur when evaporation lines are seen on the test or other chemicals interfere with it. Given article text here I've had a similar experience with Clearblue tests, where I got false negatives more than 50% of the time this month. They're also super expensive compared to other brands like First Response or Superdrug. I'm done wasting money on them and won't be buying any more. What's annoying is that these tests are faulty even when you're not pregnant - I've seen a thin blue line which isn't real, and it's giving me a false sense of security. If anyone needs reliable results, they should stick with First Response or Superdrug tests. Many people have shared their similar experiences with Clearblue tests, where the blue lines are often a sign of a faulty test rather than pregnancy. It's outrageous that a product like this is on sale and so expensive, especially when there are better alternatives available. It appears that several women have experienced false positive results with Clearblue pregnancy tests. Initially, Fluffycloudland77 shared her story of having a false positive too, followed by lggt999's suggestion to report the issue to Clearblue. BlowHole emphasized the importance of contacting them to get a refund, citing potential faulty batches. WozzelMummage expressed frustration with Clearblue tests, stating that they only gave her false hope in the past. Meanwhile, another poster mentioned successfully getting their money back from Boots after reporting the issue. In 2022, Leeseyloo77 reflected on her own experience, which involved a private scan and missed funeral due to mistaken miscarriage fears. A nurse from the hospital advised against using Clearblue, citing its notorious reputation for false positives. People who claim that colored Evap "don't exist" because they can only change color with pregnancy hormone molecules are proven wrong when their partner and cat show positive results. The negative side of Clear Blue tests all stay neg, but anyone seeing a blue line believes it's true. However, Clear Blue always shows a positive result after an hour, leading some to wonder why they don't all behave this way. It can be frustrating to get false positives, especially when you're not sure what to do next. The only positive line seen on tests after the time frame was early positive. I just don't understand how Clear Blue works if it always "turns positive" after an hour. My results are consistent with theirs but mine work differently. It seems that some people sell fake Clear Blue positive test results online, which can be misleading. A woman has experienced a chemical pregnancy, where the egg implanted and hormone production began, but fetal development stopped early on. The subsequent drop in hormone levels makes it extremely unlikely to be false positive. rogersmellyonthelley suggests that having only tested positive last week might be too early to see anything, as normal hCG levels need to reach 1000-1500 for visible signs. pestopasta is advised to wait and test again if they get a good line on their test tomorrow. Jojo0070 shares her own experience of having two babies, where the clear blue test initially showed positive but later negative results until finally confirming pregnancy with a doctor's test. She explains that early hCG hormone levels can be weak and variable, leading to false negatives if tested at the wrong time. pestopasta is reassured that their positive test result indicates they are likely pregnant. I've recently realized I'm probably ovulating, and now I want to check if I am pregnant or not. A user on the forum shared their experience with using home pregnancy tests after missing their period. They wondered if there was a hormone in birth control pills that could cause a false positive result on such tests. Another user discussed a similar situation where they took several tests, first showing a negative result but later turning positive after experiencing some spotting. Many women have shared their disappointing experiences with Clearblue pregnancy tests, reporting false positives and inaccuracies. Some users claim that these tests are not reliable and can cause unnecessary stress and financial burdens. One user recounts taking multiple Clearblue tests after receiving a positive result, only to find out she was not pregnant after further testing. Another woman reports experiencing irregular cycles and PCOS symptoms, yet still received inconsistent results from the Clearblue test. Several users have expressed their disappointment with the Clearblue brand, stating that they would never use it again due to its perceived unreliability. One user even goes so far as to say that Clearblue products should not be sold. The experiences shared by these women highlight the importance of verifying pregnancy results through multiple tests and medical professionals before making any conclusions. ` // Set a threshold for pointer movement to determine gesture type var pressThreshold = 8; if (type === 'x' ? self.element.clientWidth : self.element.clientHeight) { // Determine point at which pointer movement exceeds threshold var movePoint = Math.floor(0.5 * (type === 'x' ? self.element.clientWidth : self.element.clientHeight)); } // Set diagonals swipe conditions and limits var diagonalSwipes = false; var diagonalLimit = Math.tan(((45 * 1.5) / 180) * Math.PI); if (diagonalSwipes) { // Check for swiping in a diagonal direction when true var moveDegree = ((event.clientX - event.startX) ** 2 + (event.clientY - event.startY) ** 2) ** 0.5; if (moveDegree > diagonalLimit) { return 'diagonal'; } } // Set up gestures for swipe and mouse events on the modal var gesture = new TinyGesture(\$refs.modal, { pressThreshold: 8, diagonalSwipes: false, diagonalLimit: Math.tan(((45 * 1.5) / 180) * Math.PI), mouseSupport: true }); gesture.on('swipeleft', () => { this.\$dispatch('modal-navigate-left'); }); gesture.on('swiperight', () => { this.\$dispatch('modal-navigate-right'); });`
